

Improve customer service with a professional radio ordering system built specifically for the restaurant industry.

Mobility

NCR Orderman handheld units allow you to work faster and more efficiently by allowing each order and customer request to be placed and processed directly at the table.

Reliability

Radio technology provides reliability with obstacles such as solid walls, long range and other external signals unable to interrupt the transmission of data.

Accuracy

Avoid communication errors with NCR Orderman devices that ensure accurate handling of guest requests - orders, special requests and cancellations.

Standard Eats

Standard Eats is an app for a restaurant, bar or cafe owner working to deliver an outstanding customer experience when serving guests in a smooth and efficient way.

Having both front-end Point of Sale (POS) software combined with the back-end accounting and reporting tools in one application offers the advantage of a real-time business overview and reduces the complexity of having separate interfacing apps.

Standard Eats provides a series of industry-specific functionality for restaurant management:

- Booking management
- Taking orders and managing tables
- Kitchen order management (Workflow Overview)
- Multi-Currency

NCR Orderman

NCR Orderman develops secure and user-friendly POS terminals and handhelds specifically designed for the hospitality industry. Standard Eats' integration with NCR Orderman allows you to reduce serving time and improve guest experience by combining a restaurant management system with fast and reliable equipment.

This integration allows you to process all orders without keeping your guests waiting as every aspect of their order can be managed from the same place. By using the NCR Orderman device, items can be added directly to the order from the Standard Eats app. The order is then transmitted directly to kitchen printers and managed with the workflow overview.

NCR Orderman handhelds allow servers to take a guest's order directly at the table and manage any changes on the spot. Changes can be added to the system and applied when the payment is to be processed; this includes switching tables, splitting or merging bills and bar tabs, adding service charges, allowing multiple payment methods, and more.
